

### **Amendments to the Claims**

Please amend the claims as indicated below. All claims are listed below, with amended claims so marked. This listing of claims will replace all prior versions, and listings, of claims in the application:

- 1           1.       (Previously Presented) A method for annotating a recording with a current  
2 location comprising:  
3           monitoring, while traveling, for different types of signal sources that may be used  
4 to facilitate determining a current location;  
5           identifying a first signal source at a first time;  
6           determining a current location based at least in part on the first signal source;  
7           making a recording; and  
8           associating the current location with the recording.
- 1           2.       (Original) The method of claim 1, further comprising:  
2           logging the first time and characteristics of the signal source; and  
3           associating the current location after completing traveling.
- 1           3.       (Original) The method of claim 2, wherein characteristics of the signal  
2 source include a signal source type, a signal source strength, a signal source position,  
3 and a signal source location.

1           4.     (Original) The method of claim 1, wherein determining the current location  
2     is based at least in part on characteristics of the signal source including a signal source  
3     type, a signal source strength, a signal source position, and a signal source location.

1           5.     (Original) The method of claim 1, wherein the current location has an  
2     associated margin of error determined with respect to the type of the first signal source.

1           6.     (Original) The method of claim 1, wherein said different types of signal  
2     sources include signals from GPS, LORAN, cellular phone towers, 802.11 hotspots, and  
3     Radio Data System (RDS) transmitters.

1           7.     (Original) The method of claim 1, further comprising:  
2     identifying a second signal source different from the first signal source; and  
3     determining the current location based in part on the second signal source.

1           8.     (Original) The method of claim 1, comprising:  
2     determining a primary position determination device is not available.

1           9.     (Original) The method of claim 8, wherein the primary position  
2     determination device comprises a GPS receiver.

1           10.    (Original) The method of claim 1, further comprising:  
2     looking up the first signal source on a coverage map to determine an origin of the  
3     first signal source; and  
4     determining the current location based at least in part on the origin.

1           11.   (Original) An article of manufacture to facilitate annotating a recording  
2 with a current location, comprising:  
3           a machine-accessible medium having associated data, wherein the data, when  
4 accessed, results in a machine performing:  
5           monitoring, while traveling, for different types of signal sources that may be used  
6 to facilitate determining a current location;  
7           identifying a first signal source at a first time;  
8           determining a current location based at least in part on the first signal source;  
9           making a recording; and  
10          associating the current location with the recording.

1           12.   (Original) The article of manufacture of claim 11, wherein the machine-  
2 accessible medium further includes data, when accessed, results in the machine  
3 performing:  
4           logging the first time and characteristics of the signal source; and  
5           associating the current location after completing traveling.

1           13.   (Original) The article of manufacture of claim 12, wherein the data for  
2 logging characteristics of the signal source comprises further data, when accessed,  
3 results in the machine performing:  
4           identifying a signal source type, a signal source strength, a signal source  
5 position, and a signal source location.

1           14.   (Original) The article of manufacture of claim 11, wherein the machine-  
2   accessible medium further includes data, when accessed, results in the machine  
3   performing:

4           identifying a second signal source different from the first signal source; and  
5           determining the current location based in part on the second signal source.

1           15.   (Original) The article of manufacture of claim 11, wherein the machine-  
2   accessible medium further includes data, when accessed, results in the machine  
3   performing:

4           determining a primary position determination device is not available.

1           16.   (Original) The article of manufacture of claim 11, wherein the machine-  
2   accessible medium further includes data, when accessed, results in the machine  
3   performing:

4           looking up the first signal source on a coverage map to determine an origin of the  
5   first signal source; and  
6           determining the current location based at least in part on the origin.

1           17-24.       (Cancelled)
